# Lymph Node Status in PCa: Why Worry

- Decisions on **therapy**
- Predicting **recurrence** and assessing **prognosis**

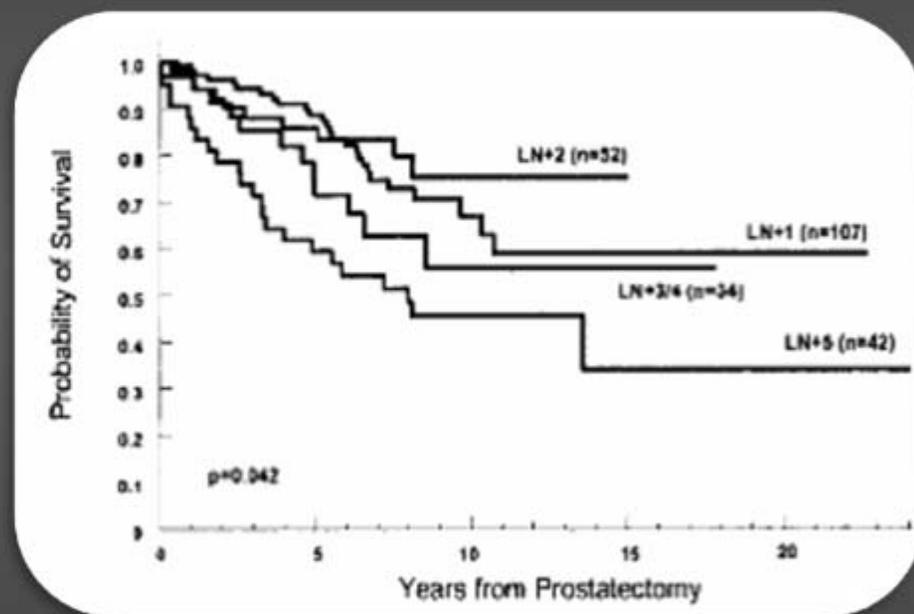

# Therapy Decisions

- Deciding on appropriate **therapy**
  - Node positive
    - Non surgical therapy

# Patient with Prostate Cancer

- Determine **prognosis**
  - Number of LN involvement affects disease progression and survival rate
    - 1-2 positive nodes (Recurrence free survival of 70 %)
    - > 5 positive nodes (Recurrence free survival 49 %)

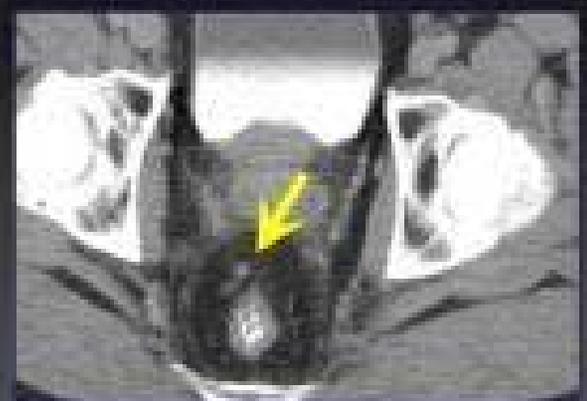

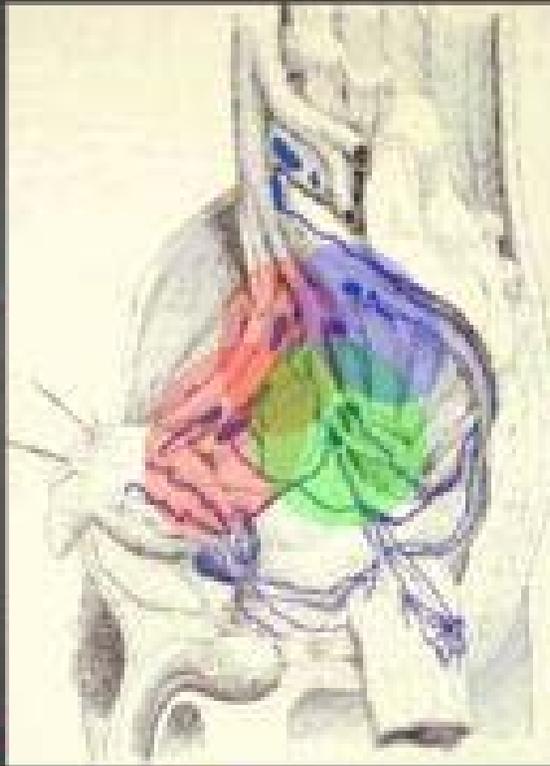

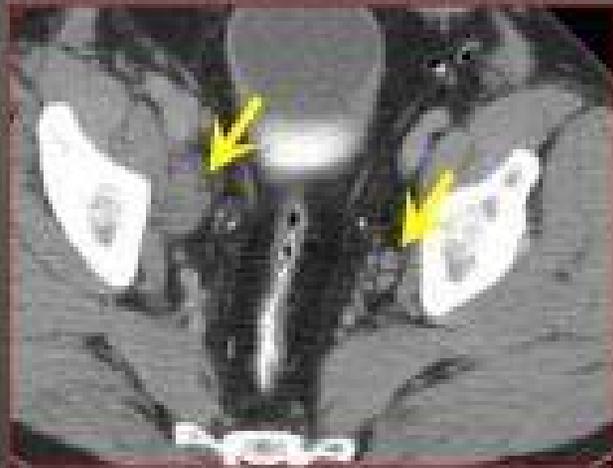

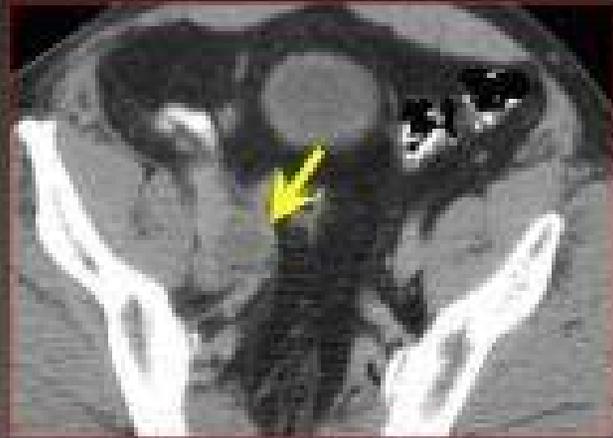

# Lymph Node Metastases

- Era of PSA screening
  - Incidence of pelvic nodal metastases dropped to < 10 % compared to 40-60% in past
- Caveats

# Lymph Node Metastases

- Caveats
  - Most studies excluded patients with high risk or aggressive prostate cancer
    - Neoadjuvant androgen ablation
    - Patients who has positive nodes with extended nodal dissection
- Although overall percentage of patients with positive LN has declined, there remains **significant numbers** of patient with LN positive cancer (**39 % in high risk patients**)

Obturator-hypogastric – 30-60 %

External Iliac – 20-50 %

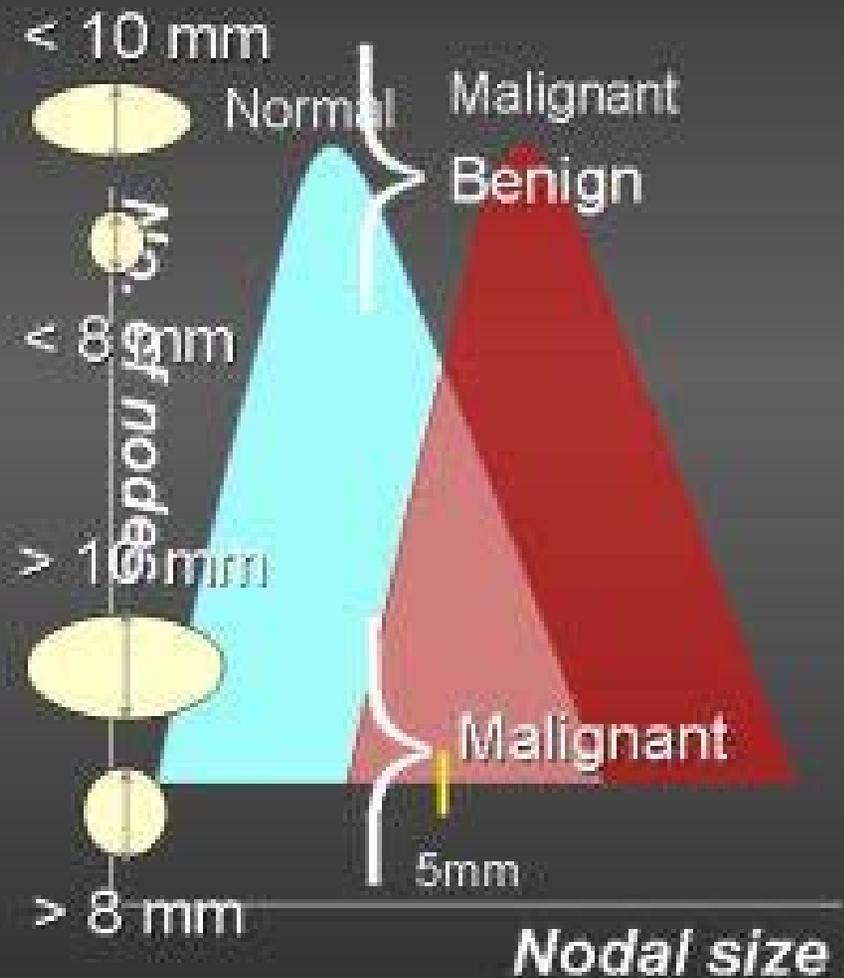

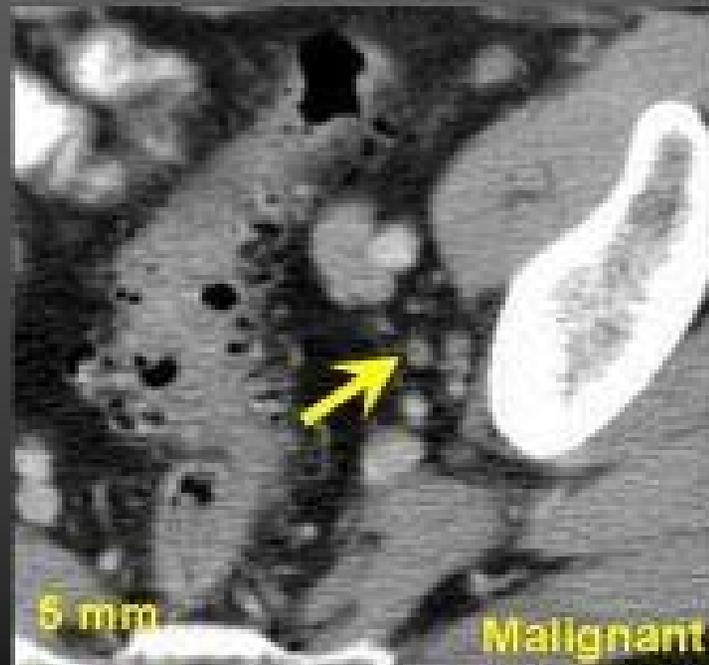

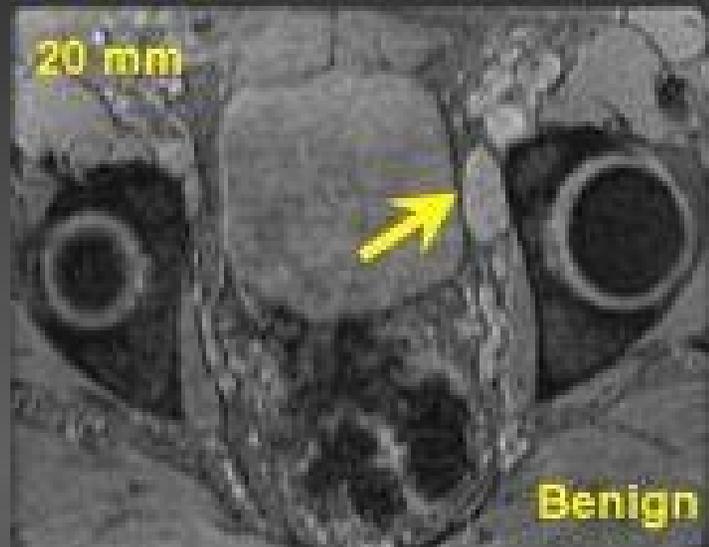

Both – 37 %

Swanson et al, Cancer 2006; 107; 439

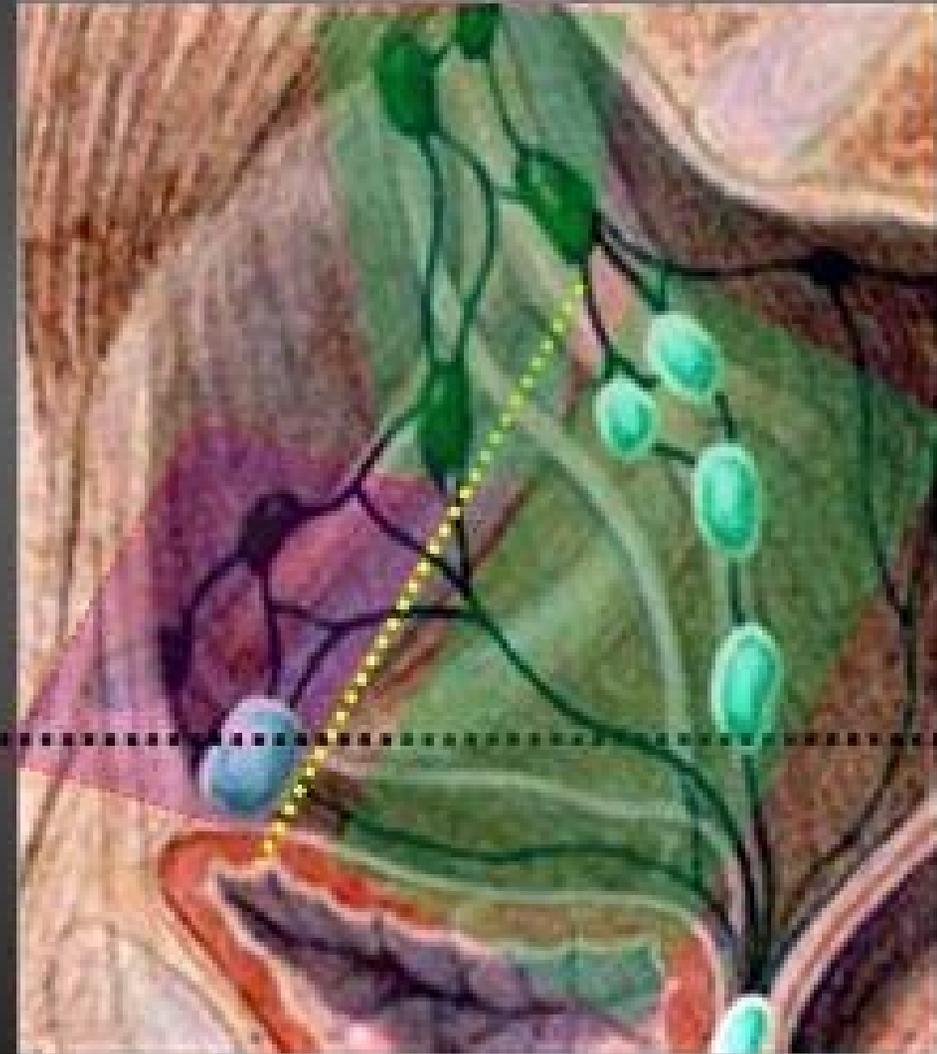

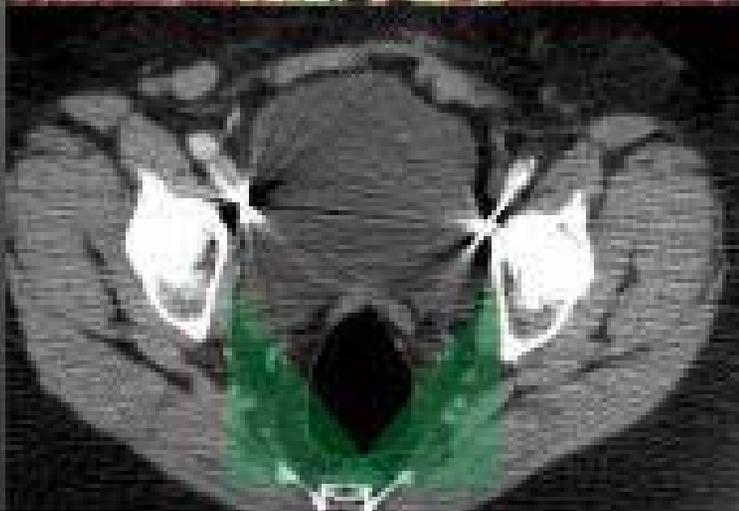

# Current Nodal Staging

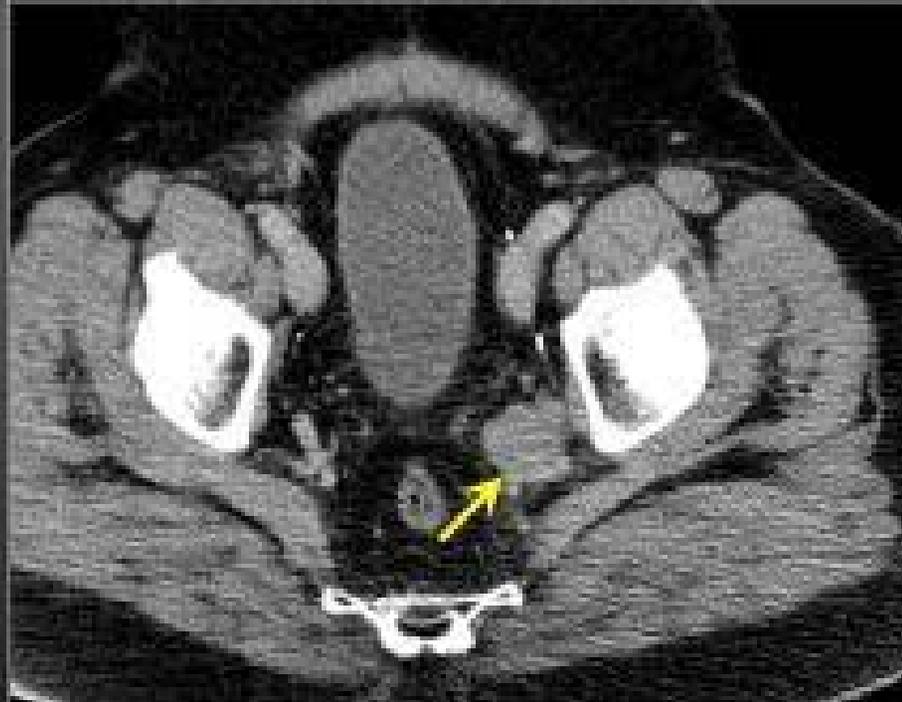

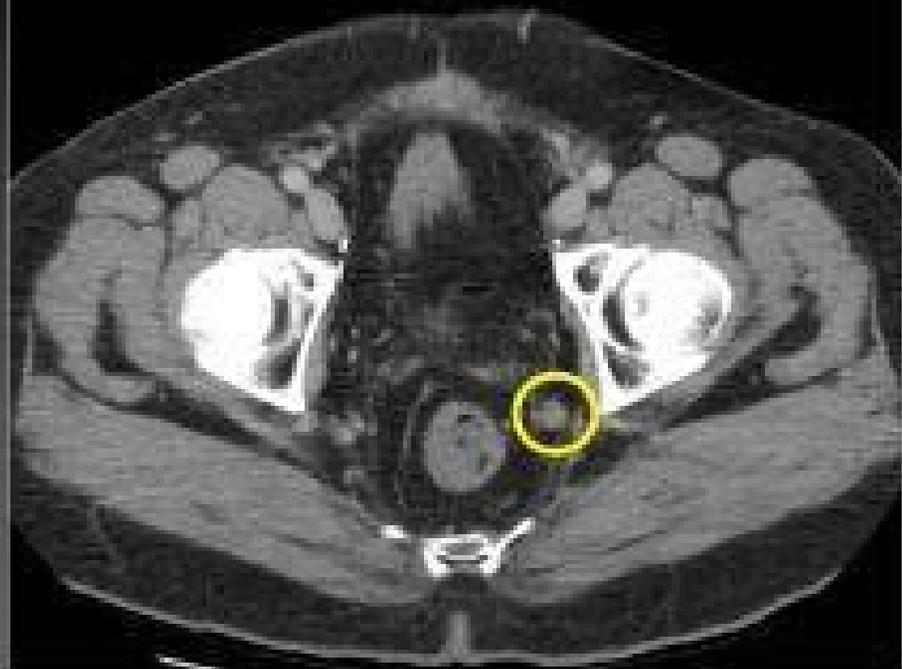

- Non Invasive
  - Cross Sectional Imaging
- Invasive
  - Surgical Nodal Sampling (Gold Standard)

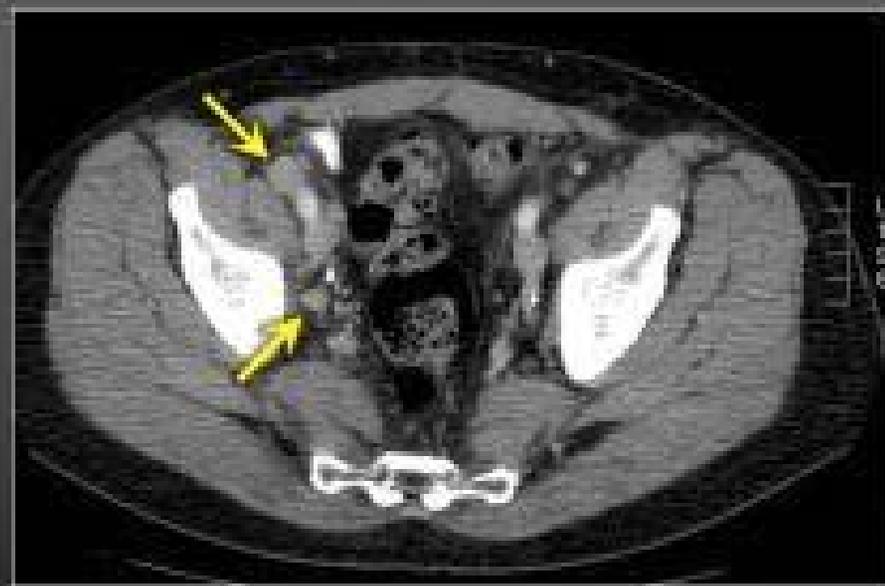

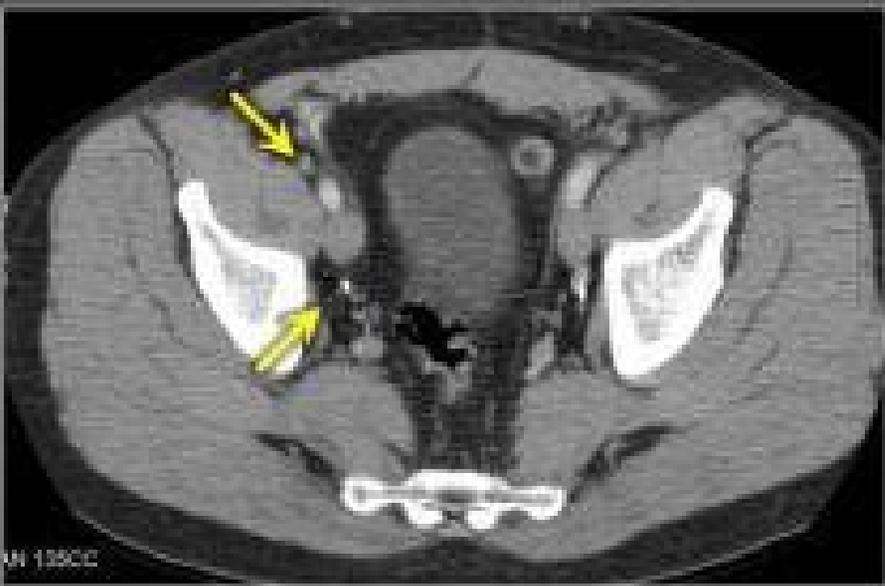

# Nodal Characterization

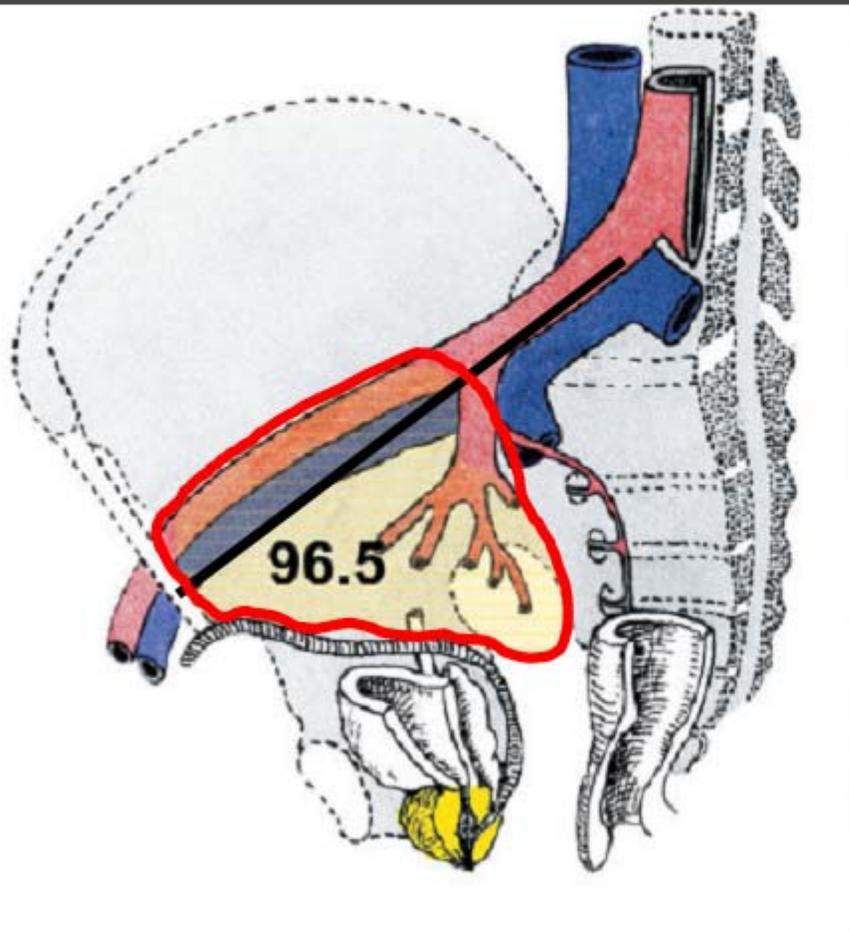

# Gold Standard

# Extended Surgical Nodal Dissection

Extended pelvic lymphadenectomy

Incidence of lymph node metastases increased from **10 % to 26.2 %**

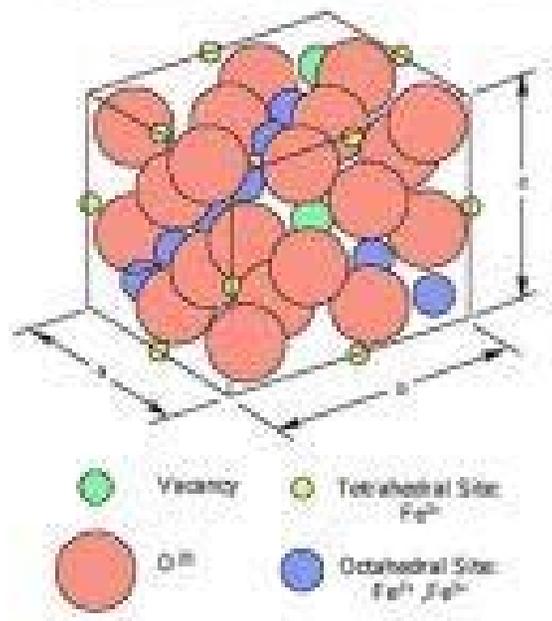

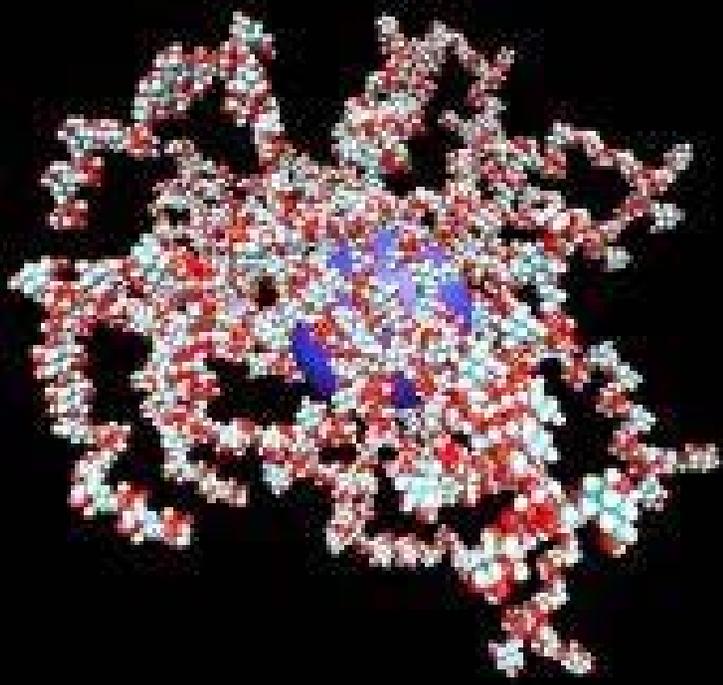

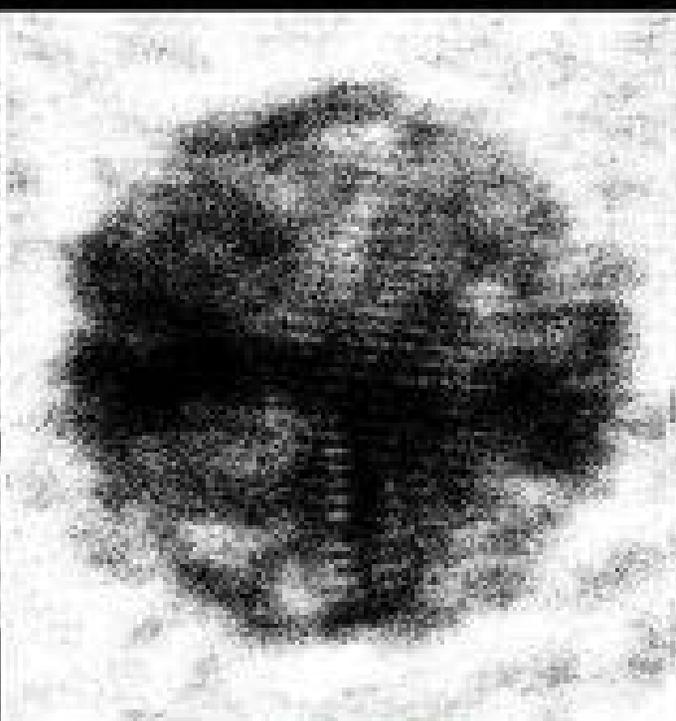

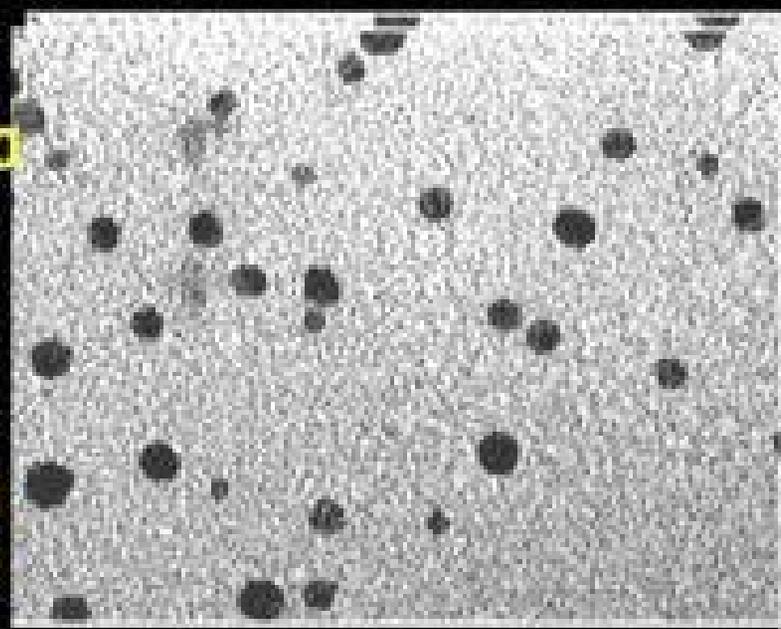

*Heidenreich et al. J Urology; April 2002*

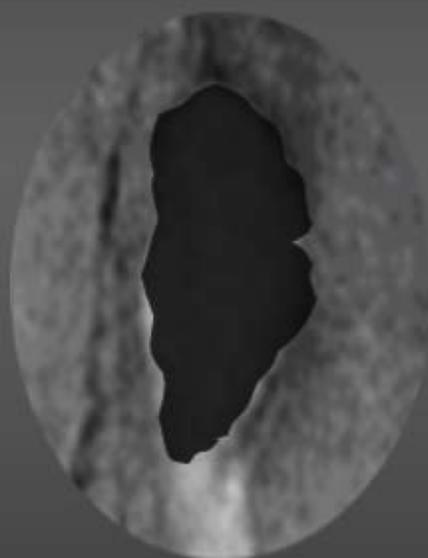

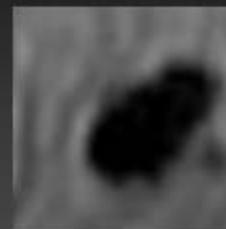

# Current Need

- Non invasive technique that detects, characterized nodes with high degree of sensitivity and specificity
- Broad anatomic coverage for all LN

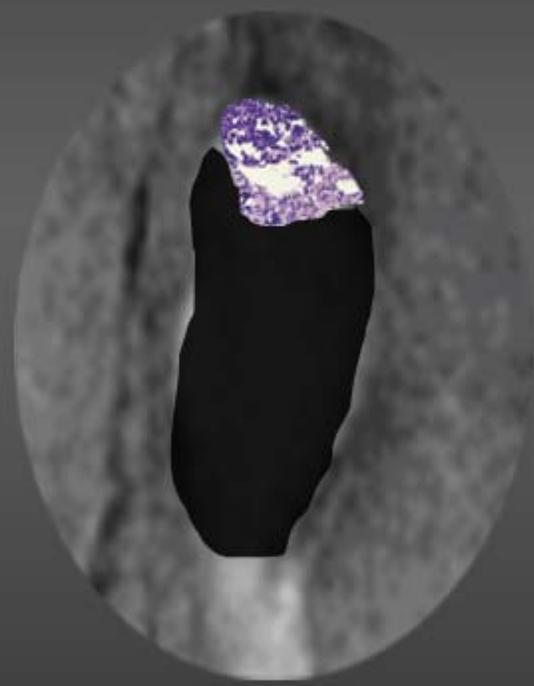

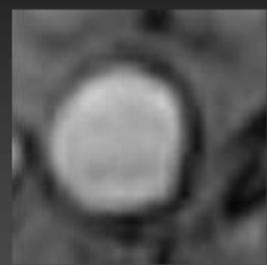

**Nanoparticles  
Ferumoxtran-10  
(Combidex)-  
LNMRI**

Size: 21 nm  
R1: 17 mMsec-1  
R2: 48 mMsec-1

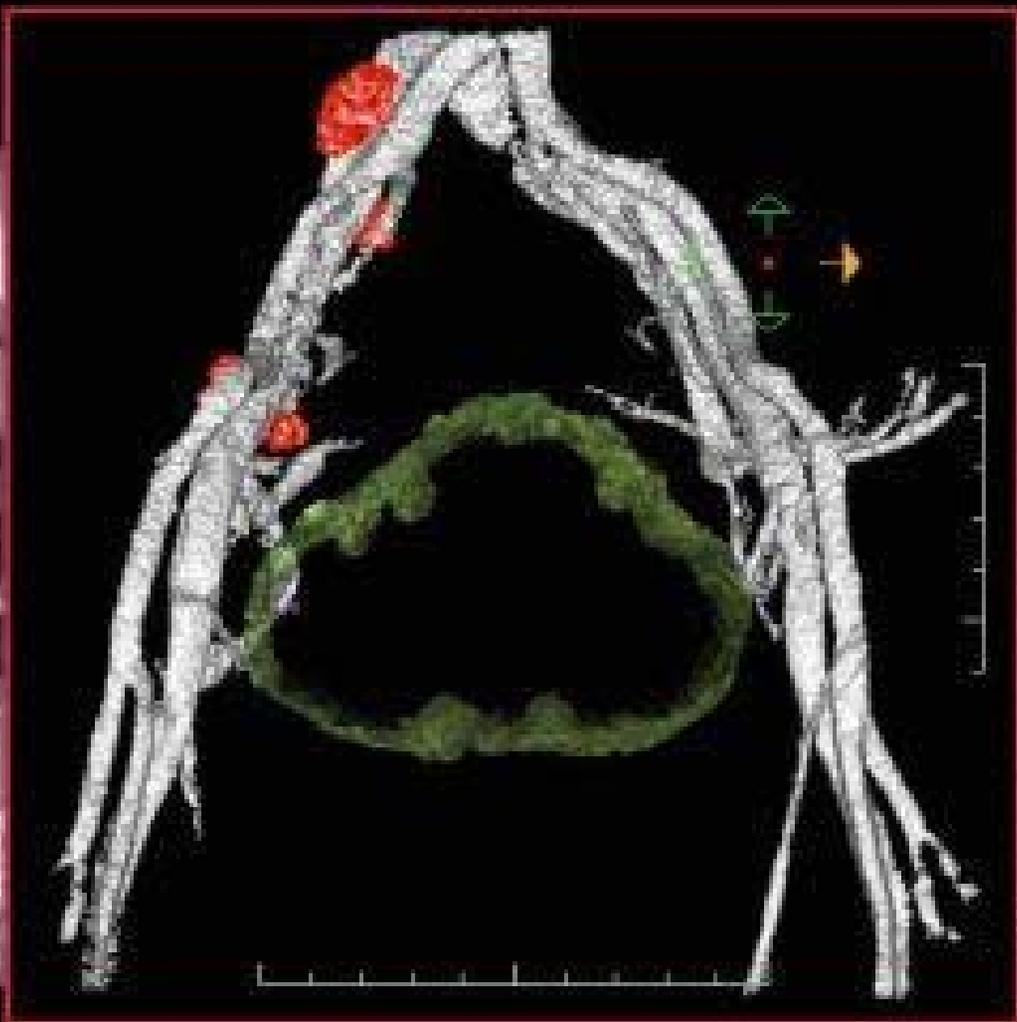

Lymph Node

Lymph Node

- n = 80 patients (T1 – T3 prostate cancer)
- **Lymphotropic Nanoparticle Enhanced MRI (LNMRI)** prior to surgery
- Direct comparison of imaging and histopathology results

# LNMRI: Micro-metastasis

post ferumoxtran-10

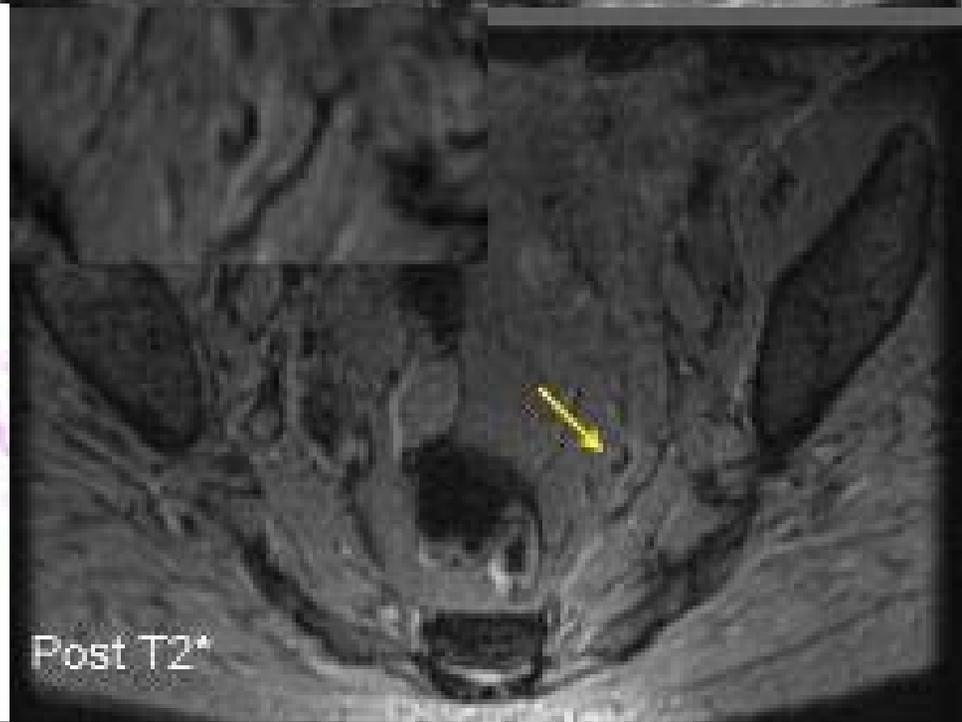

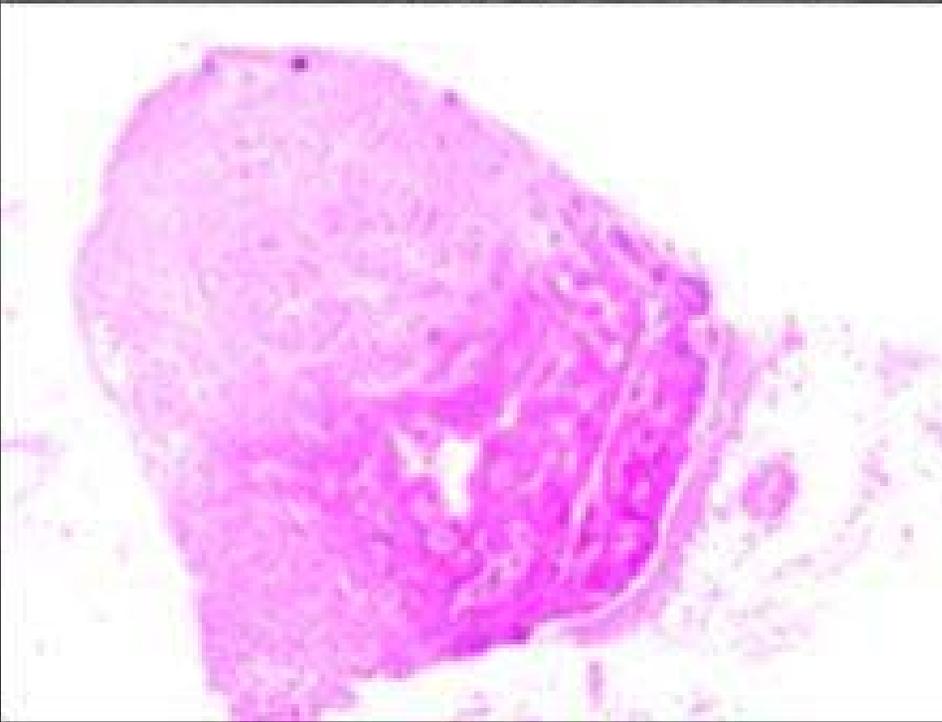

# Effects of LNMRI on patients with prostate cancer

- Staging and Surgical sampling
- Radiation therapy planning
- Response to therapy and recurrence detection

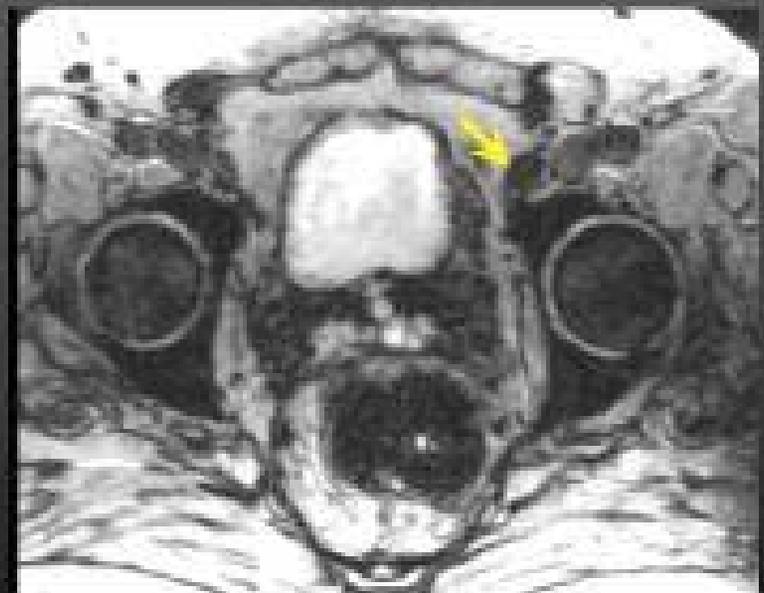

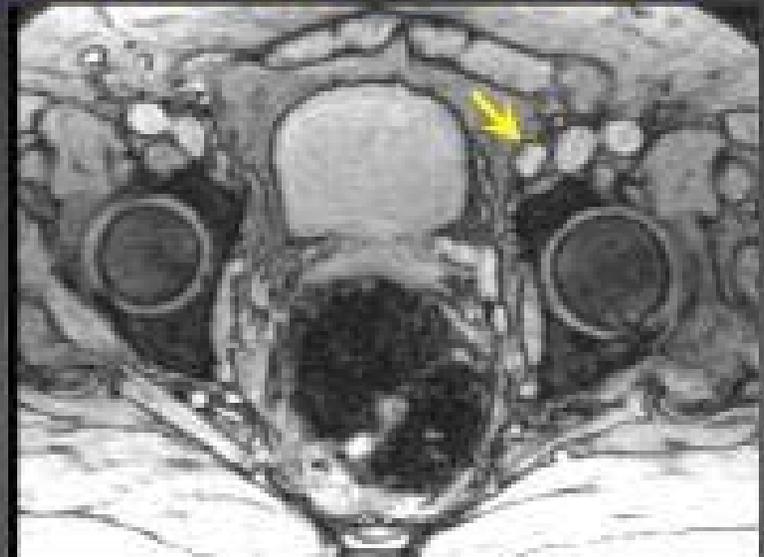

# Effects of LNMRI on patients with prostate cancer

- Staging and Surgical sampling
- Radiation therapy planning
- Response to therapy and recurrence detection

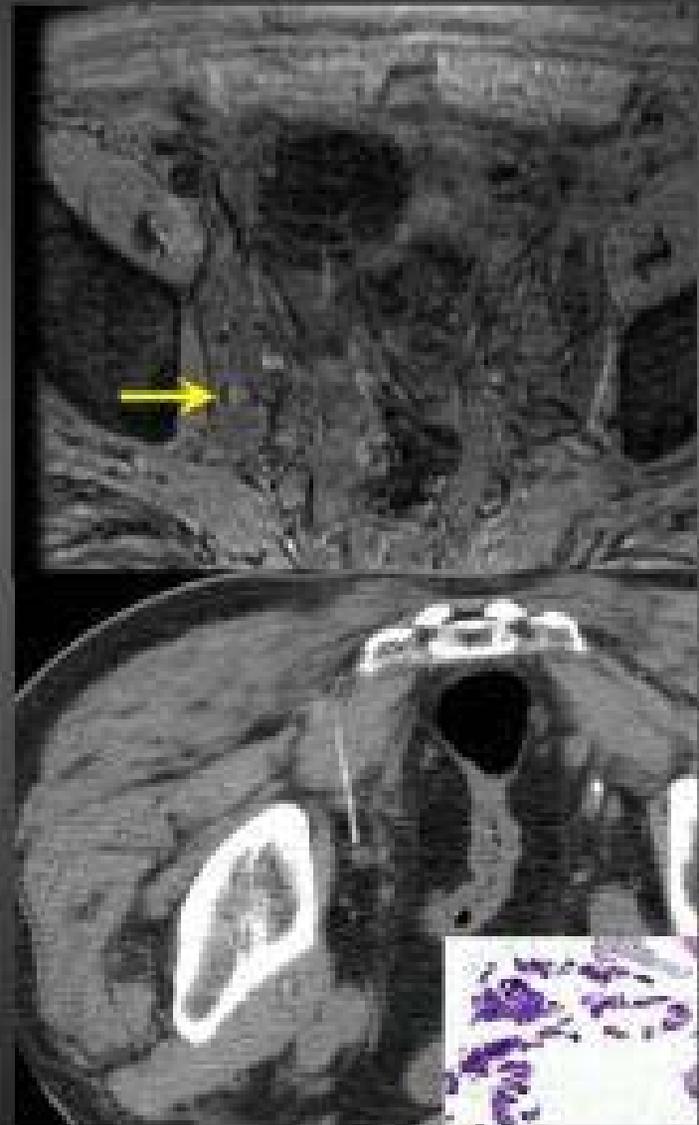

# Patient with Prostate Cancer

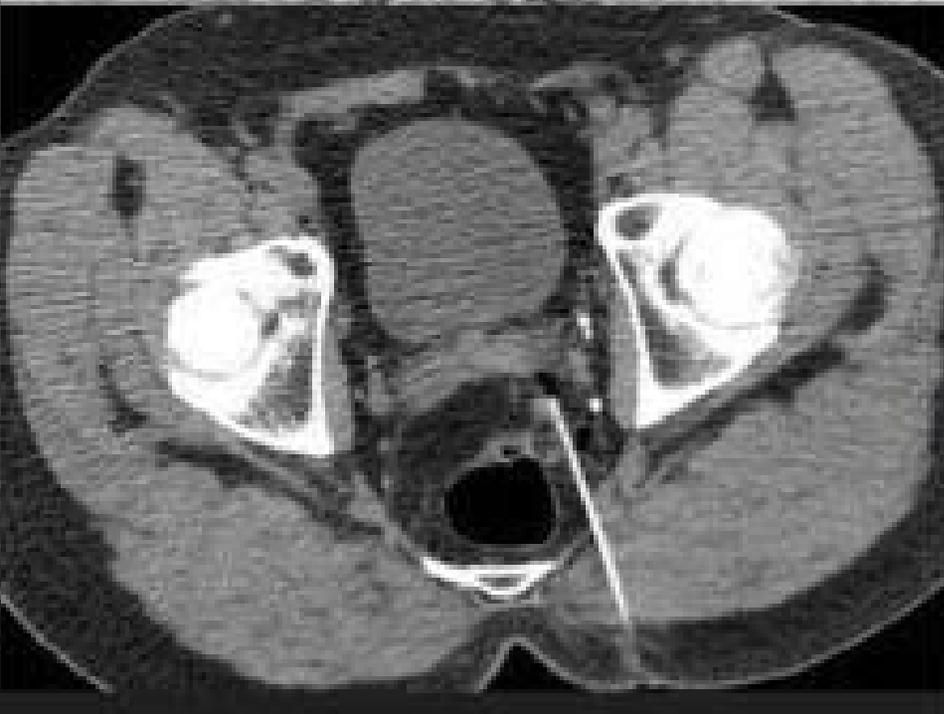

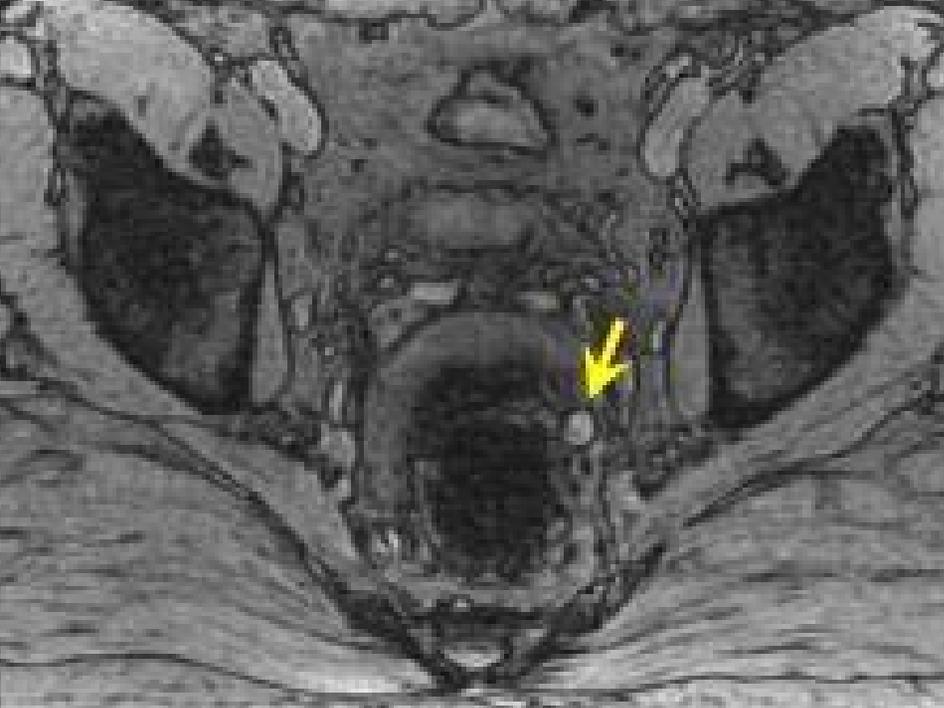

- Negative LNMRI (NPV > 95%)
  - Nodal dissection can be avoided

# Patient with Prostate Cancer

- Positive LNMRI with small (< 5 mm) lymph nodes
  - Image guided biopsy

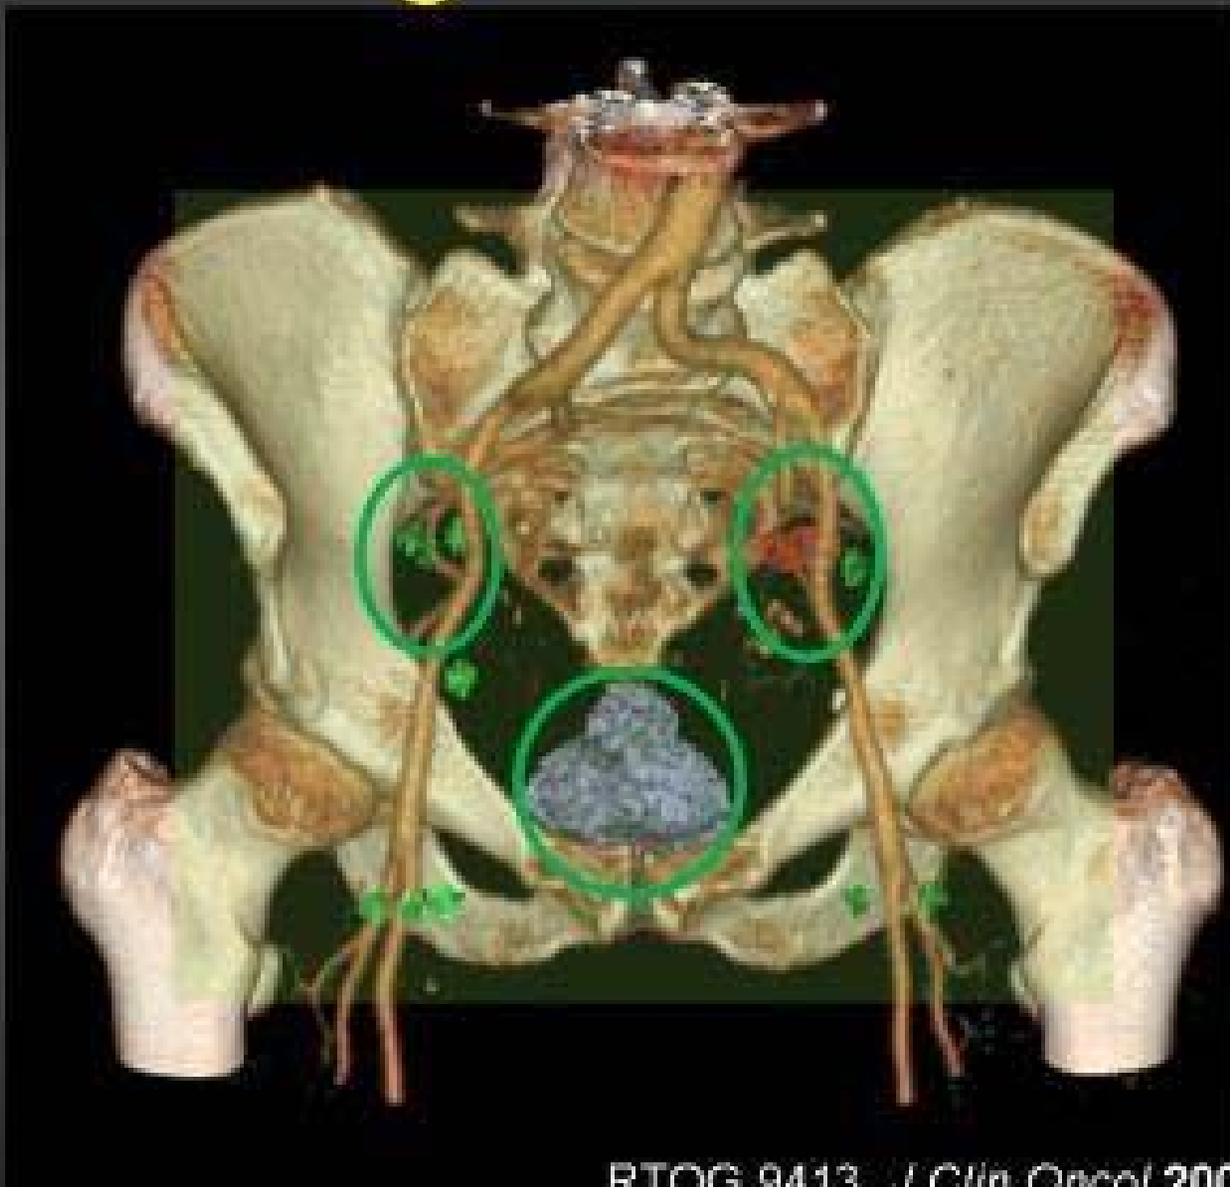

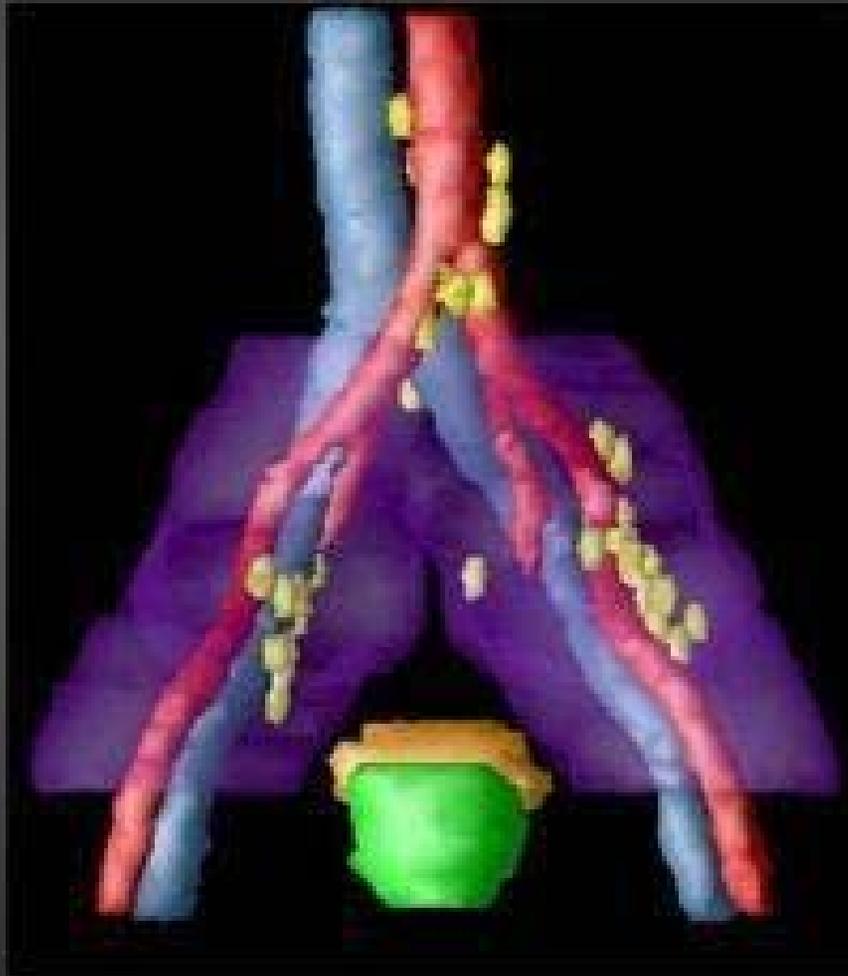

# Effects of LNMRI on patients with prostate cancer

- Staging and Surgical sampling
- Radiation therapy planning
- Response to therapy and recurrence detection

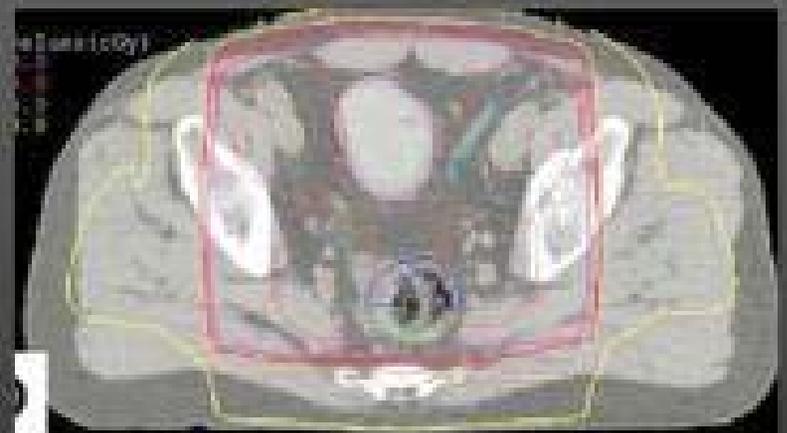

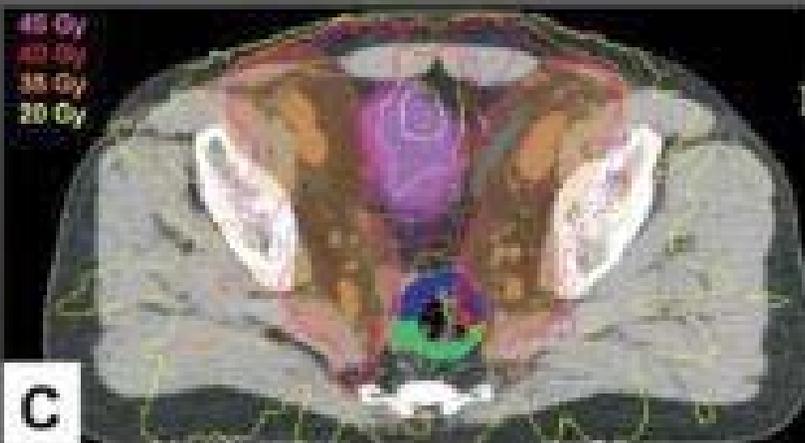

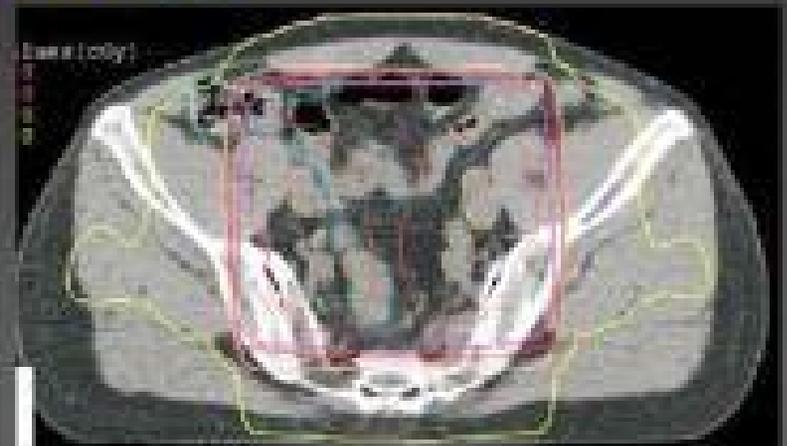

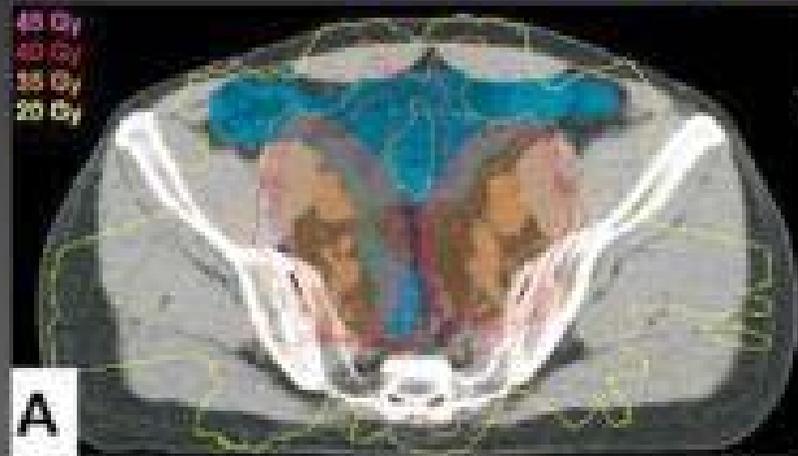

# Target Definition

# IMRT planning

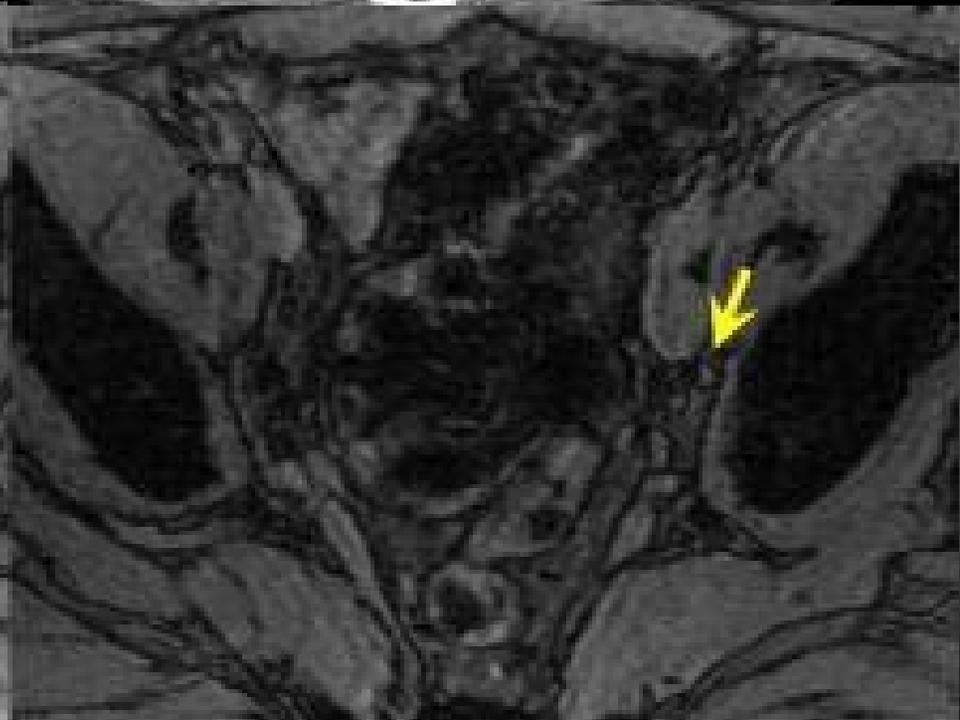

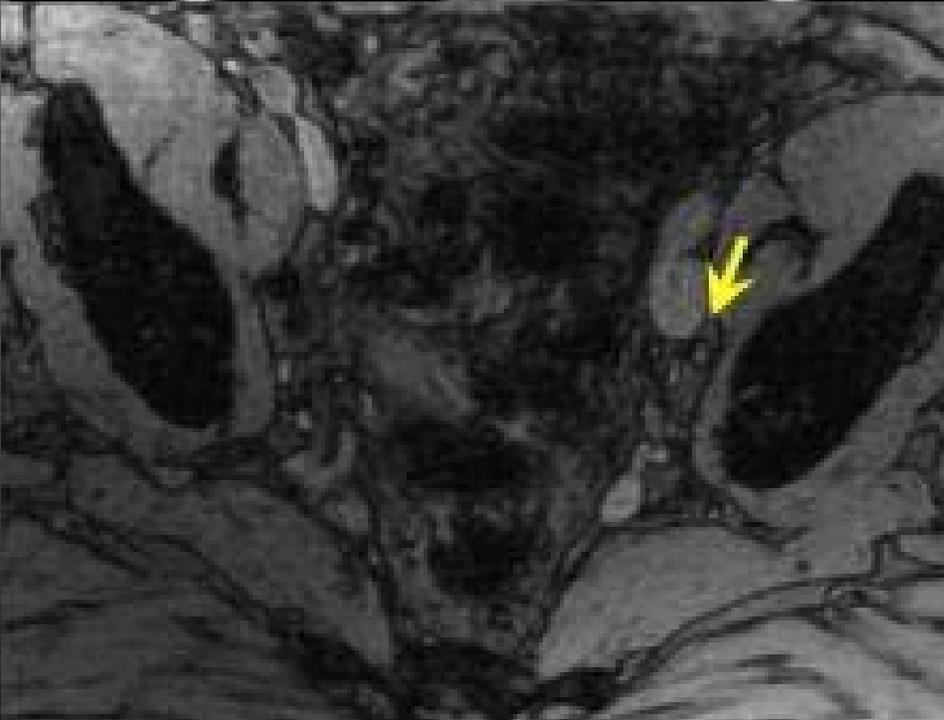

# IMRT planning

Shih et al; Int J Radiat Oncol Biol Phys 2005; 63:1262

# Effects of LNMRI on patients with prostate cancer

- Staging and Surgical sampling
- Radiation therapy planning
- Response to therapy and recurrence detection

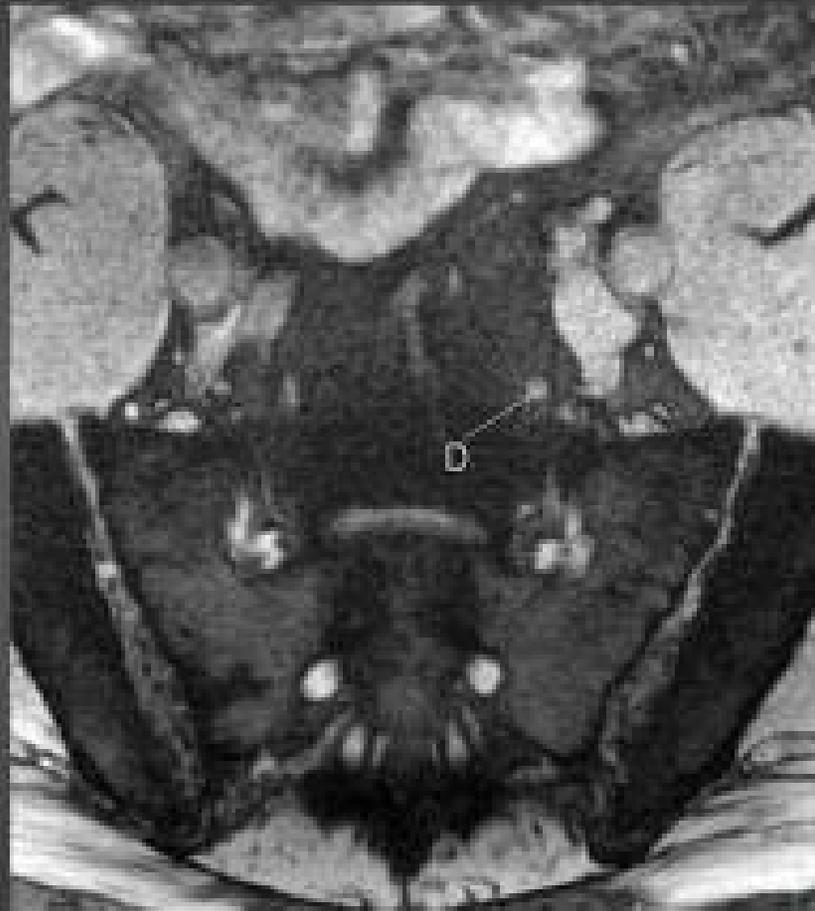

# Who should get LNMRI

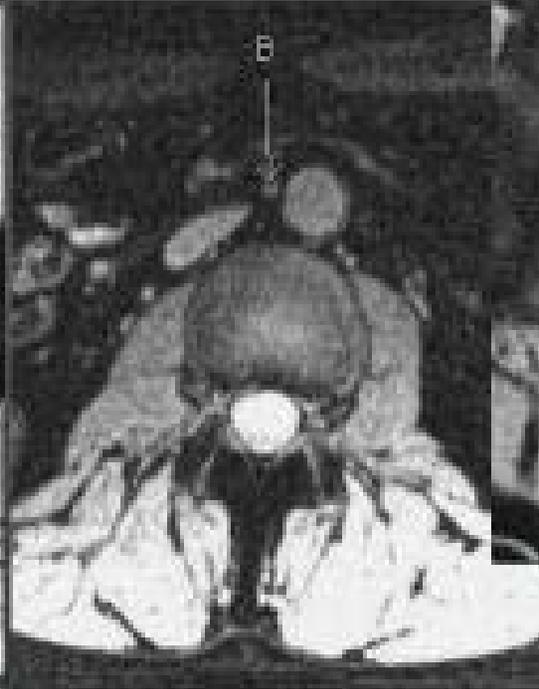

- Stratify patients with intermediate to high risk of nodal metastases
- Incorporate Partins Nomograms to MRI findings to better predict risk of nodal metastases

Wang et al; AJR 2006

# 3T: small nodes

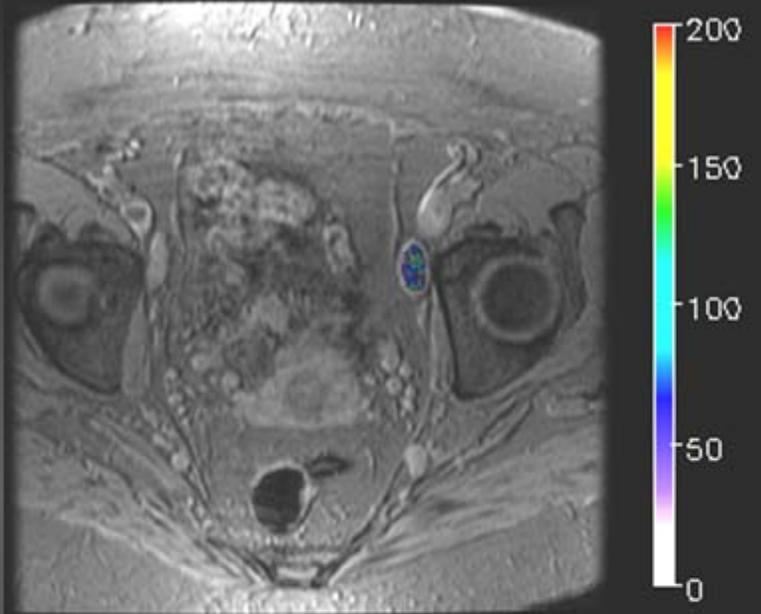

4 mm

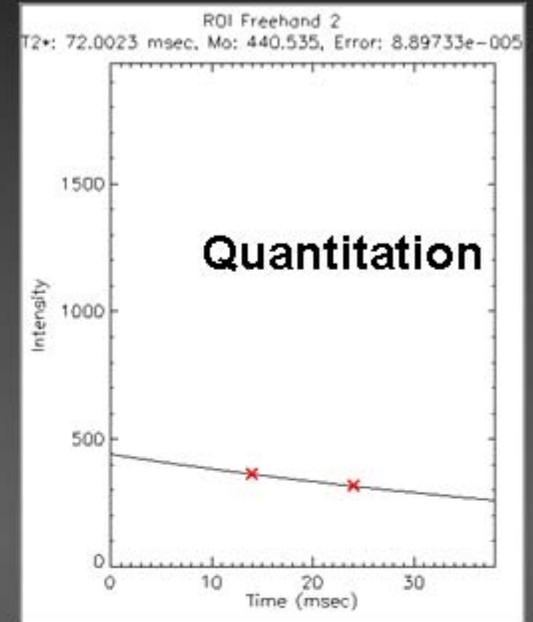

2.5 mm

# Semi Automated Algorithms

# LNMRI Results

## Meta-analysis

- Overall sensitivity 88% (85-91%)
- Overall specificity 96% (95-97%)

**LNMRI offers higher diagnostic precision than unenhanced MRI**

# Conclusion

- Overall decline in incidence of nodal metastases does not reflect occurrence in high risk patients
- LN staging is crucial for therapy planning and prognostic assessment in prostate cancer patients
- Current imaging techniques and gold standard have limitations
- Need for more accurate techniques to complement surgical staging
  - LNMRI
